Economics 302
Prof. Kelly
Problem Set 3

## Answer Key

## Exercise 1 Open Economy Equilibrium

Suppose in the country of Kelly, which is initially closed to the outside world (ie, does not trade with other nations), output is produced in each period using just two factors, capital ( $K$ ) and labor ( $L$ ) under the following production function:

$$
Y=F(K, L)=6 K^{.5} L^{.5}
$$

Kelly has a population of one million people; every individual gets an equal share of output; and each individual consumes output according to the following Keynesian consumption function, where $y$ is the output allocated to an individual and $t$ is the tax paid by each individual:

$$
c=.8(y-t)
$$

Every individual in Kelly inelastically supplies one unit of labor and four units of capital for production. We then have that $k$ is the amount of capital provided by each individual and $K$ is the total amount of capital provided for production. Similarly for $l$ and $L$. The government of Kelly runs a balanced budget and spends two million units of output per period. Every individual faces the same tax.
a) What is total ouput in the economy?

$$
\begin{aligned}
Y & =6(4 * 1,000,000)^{.5}(1,000,000)^{.5} \\
& =6,000,000(4)^{.5}(1)^{.5} \\
& =12,000,000
\end{aligned}
$$

b) What is the wage rate in the economy

$$
\begin{aligned}
w & =M P L=\frac{(1-\alpha) Y}{L} \\
& =\frac{.5}{1,000,000}(12,000,000) \\
& =6
\end{aligned}
$$

c) How much does an individual consume in the economy?

$$
\begin{aligned}
c & =.8(12-2) \\
& =8
\end{aligned}
$$

d) What is total investment $(I)$ in the economy

$$
\begin{aligned}
I & =S \\
& =Y-G-C \\
& =1,000,000(12-2-8) \\
& =2,000,000
\end{aligned}
$$

Now, suppose that we have the following investment function for each individual:

$$
i=\frac{.08}{r}
$$

e) Determine what the interest rate is in this economy.

$$
\begin{aligned}
i & =2=\frac{.08}{r} \Rightarrow \\
2 r & =.08 \\
r & =.04
\end{aligned}
$$

f) What is the interest rate if government spending increases to 3 million units and the government main-
tains a balanced budget? What if government spending decreases to 1 million units?
$\mathrm{G}=3,000,000$ which implies $\mathrm{T}=3,000,000$ so consumption must be recalculated.

$$
\begin{aligned}
c & =.8(12-3) \\
& =.8(9) \\
& =7.2
\end{aligned}
$$

$$
\begin{aligned}
I & =S \\
& =Y-G-C \\
& =1,000,000(12-3-7.2) \\
& =1,800,000
\end{aligned}
$$

$$
\begin{aligned}
i & =1.8 \Rightarrow \\
1.8 r & =.08 \\
r & =\frac{.08}{1.8} \\
r & =.044
\end{aligned}
$$

$\mathrm{G}=1,000,000$

$$
\begin{aligned}
& c=.8(12-1) \\
&=.8(11) \\
&=8.8 \\
& I=S \\
&= Y-G-C \\
&= 1,000,000(12-1-8.8) \\
&=2,200,000
\end{aligned} \quad \begin{aligned}
i & =2.2 \Rightarrow \\
2.2 r & =.08 \\
r & =\frac{.08}{2.2} \\
r & =.036
\end{aligned}
$$

g) What happens to the interest rate if government spending increases to 3 million units but does not change the tax to maintain a balanced budget? What happens if government spending decreases to 1 million units.
$G=3,000,000$ (c does not change since $t$ does not change)

$$
\begin{aligned}
I & =S \\
& =Y-G-C \\
& =1,000,000(12-3-8) \\
& =1,000,000
\end{aligned}
$$

$$
\begin{aligned}
i & =1 \Rightarrow \\
r & =.08
\end{aligned}
$$

$\mathrm{G}=1,000,000$

$$
\begin{aligned}
I & =S \\
& =Y-G-C \\
& =1,000,000(12-1-8) \\
& =3,000,000
\end{aligned}
$$

$$
\begin{aligned}
i & =3 \Rightarrow \\
3 r & =.08 \\
r & =\frac{.08}{3} \\
r & =.0267
\end{aligned}
$$

Next, assume that the economy of Kelly opens up to world trade and the world interest rate, $r^{w}$, is . 05 .
h) What is total investment in the economy?

$$
\begin{aligned}
I & =i(1,000,000)=1,000,000\left(\frac{.08}{.05}\right) \\
& =1,000,000(1.6) \\
& =1,600,000
\end{aligned}
$$

i) What are the net exports in the economy? Is Kelly a net exporter or a net importer? Provide intuition as to why this is the case.

$$
\begin{aligned}
N X & =S-I \\
& =Y-C-G-I \\
& =2,000,000-1,600,000 \\
& =400,000
\end{aligned}
$$

Kelly is a net exporter. Since the world offers a higher interest rate than Kelly would have if it were closed (. 05 vs .04 ), and investment is decreasing in the interest rate, Kelly will now save more than it invests.

Sample Answer for Question 2.
(the numerical results come from Katie Bruegger, the commentary and explanations are mine and in red.)

| GDP in constant 1995 US dollars |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Year | Canada | France | Ireland | United States |
| 1995 | $581,664,300,000$ | $1,553,129,799,680$ | $66,467,782,656$ | $7,338,399,891,456$ |
| 1996 | $591,029,700,000$ | $1,570,259,599,360$ | $71,834,599,424$ | $7,603,000,180,736$ |
| 1997 | $616,117,400,000$ | $1,600,164,593,664$ | $79,682,297,856$ | $7,942,999,900,160$ |
| 1998 | $641,261,200,000$ | $1,654,590,275,584$ | $86,725,296,128$ | $8,285,899,980,800$ |
| 1999 | $676,296,300,000$ | $1,707,754,127,360$ | $96,389,455,872$ | $8,629,099,954,176$ |
| 2000 | $707,125,600,000$ | $1,772,530,171,904$ | $105,984,942,080$ | $8,955,100,135,424$ |
| 2001 | $717,385,800,000$ | $1,809,675,845,632$ | $112,010,862,592$ | $8,977,799,708,672$ |

| Tax Revenue (\% of GDP) |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | ---: |
| Year Canada France  Ireland |  |  |  |  |  |
| 1995 | 0.18 | 0.38 | 0.31 | 0.18 |  |
| 1996 | 0.19 | 0.38 | 0.31 | 0.18 |  |
| 1997 | 0.2 | 0.39 | 0.31 | 0.19 |  |
| 1998 | 0.2 | 0.38 | 0.31 | 0.19 |  |
| 1999 | 0.2 | 0.38 | 0.31 | 0.19 |  |
| 2000 | 0.2 | 0.38 | 0.31 | 0.2 |  |
| 2001 |  | 0.19 | 0.38 | 0.31 | 0.19 |

$\qquad$
*these data were not available so I made the assumption that the \% remained relatively constant

One way to calculate the total tax revenue is to multiply the GDP by the percentages above.
When we subtract this figure from GDP, we get disposable income.
A sample formula call would be: "=B3-(B3*B13)" for Canada 1995

## A) Disposable Income (Y-T)

| Year | Canada | France | Ireland |  |
| :--- | :---: | :---: | :---: | ---: | United States 9.

## GDP in constant 1995 US dollars

| Year | Canada | France | Ireland | United States |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1995 | $581,664,300,000$ | $1,553,129,799,680$ | $66,467,782,656$ | $7,338,399,891,456$ |
| 1996 | $591,029,700,000$ | $1,570,259,599,360$ | $71,834,599,424$ | $7,603,000,180,736$ |
| 1997 | $616,117,400,000$ | $1,600,164,593,664$ | $79,682,297,856$ | $7,942,999,900,160$ |
| 1998 | $641,261,200,000$ | $1,654,590,275,584$ | $86,725,296,128$ | $8,285,899,980,800$ |
| 1999 | $676,296,300,000$ | $1,707,754,127,360$ | $96,389,455,872$ | $8,629,099,954,176$ |
| 2000 | $707,125,600,000$ | $1,772,530,171,904$ | $105,984,942,080$ | $8,955,100,135,424$ |
| 2001 | $717,385,800,000$ | $1,809,675,845,632$ | $112,010,862,592$ | $8,977,799,708,672$ |

Gross Domestic Savings as \% of GDP

| Gross Domestic Savings as \% of GDP |  |  |  |  |  |  |
| :--- | :--- | ---: | ---: | ---: | ---: | :---: |
| Year | Canada | France | Ireland |  | United States |  |
| 1995 | 0.19 | 0.19 | 0.23 | 0.16 |  |  |
| 1996 | 0.19 | 0.19 | 0.26 | 0.17 |  |  |
| 1997 | 0.2 | 0.2 | 0.27 | 0.18 |  |  |
| 1998 | 0.19 | 0.21 | 0.27 | 0.18 |  |  |

$\qquad$

MFP \% growth based on 'harmonised' price indices for ICT capit

| Year | Canada | France | Ireland | United States |
| :--- | ---: | ---: | ---: | :---: |
| 1995 | 0.9 | 1.4 | 4.8 | -0.1 |
| 1996 | -0.9 | 0.0 | 3.6 | 1.7 |
| 1997 | 1.8 | 1.2 | 8.3 | 1.1 |
| 1998 | 0.7 | 2.1 | 2.2 | 1.0 |
| 1999 | 1.6 | 1.1 | 5.5 | 1.3 |
| 2000 | 2.3 | 3.0 | 4.1 | 1.2 |
| 2001 | 0.1 | 0.9 | 2.8 | 0.7 |

## Labor Force Statistics Data

| Year | Canada | France | Ireland | United States |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1995 | $14,750,100$ | $24,842,600$ | $1,449,600$ | $132,304,000$ |
| 1996 | $14,899,500$ | $25,111,000$ | $1,498,100$ | $133,943,000$ |
| 1997 | $15,153,000$ | $25,285,300$ | $1,530,700$ | $136,297,000$ |
| 1998 | $15,417,700$ | $25,590,100$ | $1,612,800$ | $137,673,000$ |
| 1999 | $15,721,200$ | $25,898,000$ | $1,680,100$ | $139,368,000$ |
| 2000 | $15,999,000$ | $26,212,400$ | $1,738,800$ | $142,583,000$ |
| 2001 | $16,246,000$ | $26,443,900$ | $1,775,000$ | $143,734,000$ |

We have savings as a percentage of GDP, but that is not the same as the mps, since mps is the percent of disposable income saved. We can use the percentages above to calculate the total savings in the same way we computed the total tax revenue, and then divide this number by the disposable income we calculated above: Savings=mps(Y-T) so mps=Savings/(Y-T)
B) Average Savings Rate

| Year | Canada | France | Ireland |  | United States |  |
| :--- | :---: | :---: | :---: | :---: | ---: | :---: |
| 1995 | 0.23 | 0.31 | 0.33 | 0.20 |  |  |
| 1996 | 0.23 | 0.31 | 0.38 | 0.21 |  |  |
| 1997 | 0.25 | 0.33 | 0.39 | 0.22 |  |  |
| 1998 | 0.24 | 0.34 | 0.39 | 0.22 |  |  |
| 1999 | 0.26 | 0.35 | 0.38 | 0.22 |  |  |
| 2000 | 0.30 | 0.35 | 0.38 | 0.23 |  |  |
| 2001 | 0.28 | 0.34 | 0.35 | 0.20 |  |  |
| AVERAGE | $\mathbf{2 5 . 7 2 \%}$ | $\mathbf{3 3 . 2 6 \%}$ | $\mathbf{3 7 . 0 6 \%}$ | $\mathbf{2 1 . 3 1 \%}$ |  |  |

When we use these averages later, it's important to remember that a mps of $20 \%$ means that the $\mathbf{m p s}=$.2. If you input $\mathbf{m p s}=\mathbf{2 0}$ into your equations, everything can get messed.

## Average MFP

| Year | Canada | France | Ireland | United States |
| :--- | :---: | ---: | :---: | :---: |
| 1995 | 0.9 | 1.4 | 4.8 | -0.1 |
| 1996 | -0.9 | 0.0 | 3.6 | 1.7 |
| 1997 | 1.8 | 1.2 | 8.3 | 1.1 |
| 1998 | 0.7 | 2.1 | 2.2 | 1.0 |
| 1999 | 1.6 | 1.1 | 5.5 | 1.3 |
| 2000 | 2.3 | 3.0 | 4.1 | 1.2 |
| AVERAGE | $\mathbf{0 . 9 4 \%}$ | 0.9 | $\mathbf{1 . 3 9 \%}$ | $\mathbf{4 . 4 6 \%}$ |

In the dataset, the labor force was given in 1,000s so you had to multiply the numbers they gave you by 1,000 . If the US has a pop of $\mathbf{3 0 0}$ million, a labor force of $\mathbf{1 4 3}$ thousand just doesn't make ser
C)Average Growth Rate of Output

| Year | Canada | France | Ireland | United States |
| :--- | ---: | ---: | ---: | ---: |
| 1995 | 2.782975 | 1.670115 | 9.864214 | 2.699597 |
| 1996 | 1.610094 | 1.102924 | 8.074312 | 3.605695 |
| 1997 | 4.24475 | 1.904461 | 10.92468 | 4.471915 |
| 1998 | 4.080999 | 3.401252 | 8.838854 | 4.31701 |
| 1999 | 5.463479 | 3.213116 | 11.14341 | 4.141976 |
| 2000 | 4.558552 | 3.793053 | 9.954907 | 3.777915 |
| 2001 | 1.450959 | 2.095632 | 5.685641 | 0.2534824 |
| AVERAGE | $\mathbf{3 . 4 6 \%}$ | $\mathbf{2 . 4 5 \%}$ | $\mathbf{9 . 2 1 \%}$ | $\mathbf{3 . 3 2 \%}$ |

Some of you inadvertently used the indices for MFP instead of the percent changes. Like a CPI you could have calculated the percent change as the difference in the index but the \% change was provided in the same workbook, but in a different sheet so you didn't have to make these calculations

A's

| Year | Canada | France | Ireland |  | United States |  |
| :--- | ---: | ---: | ---: | ---: | ---: | :---: |
| 1995 | 1230 | 1230 | 1230 | 1230 |  |  |
| 1996 | 1241.536802 | 1247.156264 | 1284.900402 | 1242.236417 |  |  |
| 1997 | 1253.181813 | 1264.551827 | 1342.251255 | 1254.594565 |  |  |
| 1998 | 1264.936048 | 1282.190026 | 1402.161932 | 1267.075657 |  |  |
| 1999 | 1276.800533 | 1300.074246 | 1464.746691 | 1279.680913 |  |  |
| 2000 | 1288.776301 | 1318.207918 | 1530.124888 | 1292.411571 |  |  |
| 2001 | 1300.864396 | 1336.594522 | 1598.421207 | 1305.268878 |  |  |

All countries were assumed to have $\mathbf{A}=1230$ in 1995, but remember, A changes over time, and the growth rate of $A$ is different from country to country. To get A for the US in 1996, you have to multiply: 1230*US growth rate. To get A for Ireland in 1999, you have to multiply $1230 *($ Irish growth rate)^4, since we are 4 years removed from 1995.
D) Average Population Growth Rate

| Year | Canada | France | Ireland | United States |
| :--- | ---: | ---: | ---: | ---: |
| 1995 | 0.8278363 | 0.3168697 | 0.8643578 | 1.287712 |
| 1996 | 1.077502 | 0.3141454 | 0.8294214 | 1.283272 |
| 1997 | 1.056011 | 0.3131616 | 0.9863093 | 1.278792 |
| 1998 | 0.8666112 | 0.325884 | 1.192426 | 1.274639 |
| 1999 | 0.8263829 | 0.3794293 | 1.337992 | 1.27008 |
| 2000 | 0.8846293 | 0.4646303 | 1.346555 | 1.265844 |
| 2001 | 1.008868 | 0.5047265 | 1.35454 | 1.090327 |
| Average | $\mathbf{0 . 9 4 \%}$ | $\mathbf{0 . 3 7 \%}$ | $\mathbf{1 . 1 3 \%}$ | $\mathbf{1 . 2 5 \%}$ |

## E) Equilibrium Capitalt to Labor Ratio

| Year | Canada | France | Ireland | United States |
| :---: | :---: | :---: | :---: | :---: |
| 1995 | 137,512 | 204,900 | 158,050 | 99,031 |
| 1996 | 139,451 | 209,202 | 168,749 | 100,512 |
| 1997 | 141,418 | 213,594 | 180,172 | 102,016 |
| 1998 | 143,412 | 218,079 | 192,368 | 103,542 |
| 1999 | 145,435 | 222,657 | 205,390 | 105,091 |
| 2000 | 147,486 | 227,332 | 219,294 | 106,663 |
| 2001 | 149,565 | 232,105 | 234,139 | 108,259 |

For steady state, we know: $\mathrm{sf}(\mathrm{k})=(\operatorname{delta}+\mathrm{n}+\mathrm{g}) \mathrm{k}$.
$f(k)=Y / L=\left(A^{*} K^{\wedge}(1 / 3) * L^{\wedge}(2 / 3)\right) / L=A^{*}(K / L)^{\wedge}(1 / 3) *(L / L)^{\wedge}(2 / 3)$
$f(k)=A^{*} \mathbf{k}^{\wedge}(1 / 3)$
We thus have: $\operatorname{sAk}^{\wedge}(\mathbf{1} / \mathbf{3})=(\mathrm{delta} \mathbf{+ n + g}) \mathbf{k}$.
Solve for k by dividing both sides by $\mathrm{k}^{\wedge}(1 / 3)$ and (delta+ $\mathrm{n}+\mathrm{g}$ ):
$\mathrm{sA} /($ delta $+\mathrm{n}+\mathrm{g})=\mathrm{k}^{\wedge}(2 / 3)$
$\mathrm{k}=(\mathrm{sA} /(\operatorname{delta}+\mathrm{n}+\mathrm{g}))^{\wedge}(3 / 2)$

## F) Actual $K$

| Year | Canada | France | Ireland | United States |  |
| :--- | :---: | ---: | ---: | ---: | :---: |
| 1995 | 32,955 | 131,316 | 51,805 | 91,700 |  |
| 1996 | 32,616 | 126,055 | 51,972 | 95,407 |  |
| 1997 | 34,155 | 125,337 | 58,333 | 100,227 |  |
| 1998 | 35,550 | 128,233 | 56,403 | 107,168 |  |
| 1999 | 38,246 | 130,489 | 60,089 | 113,267 |  |
| 2000 | 40,335 | 134,992 | 63,213 | 114,764 |  |
| 2001 | 39,113 | 134,223 | 61,534 | 109,580 |  |

To get actual $k$, just use the result from above: $f(k)=A^{*} k^{\wedge}(1 / 3)$ and $f(k)=Y / L=G D P / L a b o r$ force. Plugging in and solving for $k$ yields $\mathrm{k}=(\mathrm{Y} / \mathrm{AL})^{\wedge} 3$

## Differences between steady state and actual $k$

| Year | Canada | France | Ireland | United States |
| :---: | :---: | :---: | :---: | :---: |
| 1995 | 104,557 | 73,584 | 106,244 | 7,331 |
| 1996 | 106,835 | 83,147 | 116,777 | 5,105 |
| 1997 | 107,263 | 88,257 | 121,839 | 1,789 |
| 1998 | 107,862 | 89,846 | 135,965 | -3,626 |
| 1999 | 107,189 | 92,169 | 145,301 | -8,176 |
| 2000 | 107,151 | 92,340 | 156,081 | -8,101 |
| 2001 | 110,452 | 97,882 | 172,605 | -1,321 |

The data matches fairly well for the U.S., but not the other countries. This is because we made the assumption that technology is the same in all of the countries, and used the level of technology in the U.S.

Notice also, that $\mathrm{k}^{*}$ is increasing in A (it's in the numerator) while k is decreasing in A (it's in the denominator). For Canada, we have that $\mathrm{k}^{*}>\mathrm{k}$, or in other words, we need $\mathrm{k}^{*}$ to go down and k to go up. One way for this to happen is to decrease A. So the wildly different numbers for Canada, France, and Ireland can be partly explained by technology differences between them and the US.

If we look at the US data, notice that for 1995-1997, k is below k * and so we would expect that k would become closer to $\mathrm{k}^{*}$ as time passed. Indeed, this occurs as we can see in the last table. Many people believed that because of the dot-com bubble, the US economy become over-capitalized. We might be seeing this in 1998, 1999, and 2000. In 2001, we see the capital stock fall back towards its steady state level.

Pretty amazing that our simple model seems to capture so much of what occurred in the US! And that you all had the tools to maturely analyze this!

I should admit, I finally settled on a value for A so that the US would be near steady state in 2001. What impact that has, I don't really know.
