1. Suppose the economy is described by the following equations (so we are looking at a closed economy):

• Real Sector
  1. \( Y = Z \)  
     Output equals aggregate demand, an equilibrium condition
  2. \( Z = C + I + G \)  
     Definition of aggregate demand
  3. \( C = c_o + c_1Y_D \)  
     Consumption fn, \( c_1 \) is the marginal propensity to consume
  4. \( Y_D = Y - T + Tr \)  
     Definition of disposable income
  5. \( T = t_iY \)  
     Tax function; \( t_i \) is marginal tax rate.
  6. \( Tr = TR_o \)  
     Transfer payments; \( TR_o \) is lump sum transfers.
  7. \( I = b_0 + b_1Y - b_2i \)  
     Investment function
  8. \( G = GO_o \)  
     Government spending on goods and services, exogenous

• Asset Sector
  9. \( \frac{M^d}{P} = \frac{M^s}{P} \)  
     Equilibrium condition
  10. \( \frac{M^s}{P} = \frac{M_0}{P} \)  
      Real money supply
  11. \( \frac{M^d}{P} = \mu_o + Y - hi \)  
      Real money demand

1.1 Solve for the IS curve (\( Y \) as a function of \( i \)).
1.2 Solve for the LM curve (\( i \) as a function of \( Y \)). What is the channel by which monetary influences affect the real goods sector in this model?
1.3 Solve for the equilibrium value of \( Y \).
1.4 Graph the IS and LM curves on one diagram. Clearly indicate the intercepts and the slopes. Label the equilibrium income and interest rate \( Y_0 \) and \( i_0 \).

2.1 Assume \( G \) increases by \( \Delta GO \), and is completely bond financed (and there are no portfolio effects here). Calculate the government spending multiplier.
2.2 Suppose instead \( Tr \) decreases by \( \Delta TR \). Calculate the government transfers multiplier.
2.3 Redraw your answer to 1.4. Then in the same graph, show what happens to the equilibrium income and interest rate if government spending on goods and services is increased by \( \Delta GO \). Include in your graph the level of income that would be achieved if somehow the interest rate stayed constant (label this point \( Y_A \)).
2.4 At the new equilibrium, do we know if investment is higher or lower than the level it started out at? Do we know if it is higher or lower than at $Y_d$?

2.5 Suppose the Fed targets the interest rate at $i_0$ (call this $i_{\text{target}}$). Returning to 2.3, show graphically what happens if government is increased. What happens to the level of investment?

3. Consider a situation where the economy is in a liquidity trap.

3.1 Draw a diagram illustrating the situation where interest rates are at the zero lower bound.

3.2 Show what happens to the equilibrium income and interest rate if the money supply is increased.

3.3 Show what happens if lump sum transfers are decreased. Does investment rise or fall?
